Evidence Summary/References 12
Guideline Development Process and Team 12

Last guideline approval: April 2019

Guidelines are systematically developed statements to assist patients and providers in choosing appropriate health care for specific clinical conditions. While guidelines are useful aids to assist providers in determining appropriate practices for many patients with specific clinical problems or prevention issues, guidelines are not meant to replace the clinical judgment of the individual provider or establish a standard of care. The recommendations contained in the guidelines may not be appropriate for use in all circumstances. The inclusion of a recommendation in a guideline does not imply coverage. A decision to adopt any particular recommendation must be made by the provider in light of the circumstances presented by the individual patient.
Major Changes as of April 2019

Following scheduled review, the KP Washington Osteoporosis Guideline team determined that there were no outstanding evidence gaps and re-approved the guideline with only minor changes to content. The KPWA guideline is in alignment with current KP National clinical guidance. A new shared decision-making section for talking with patients about the risks and benefits of oral bisphosphonate treatment is now included.

Definitions

**Fragility fracture** is one caused by a degree of trauma not expected to cause a fracture; for example, a fall from standing height or lower. Fragility fractures, such as vertebral compression fractures and distal forearm fractures, are common in the elderly but can occur at any age.

**Major osteoporotic fracture** is a fracture of the hip, spine (clinical), wrist, or humerus.

**Osteoporosis** is defined as a history of fragility fracture and/or a T-score of -2.5 or lower on dual energy X-ray absorptiometry (DEXA).

**Low bone mass** (or osteopenia) is defined as a T-score between -1.0 and -2.5 on DEXA.

Primary Prevention

The following are effective strategies for preventing osteoporosis:

**Fall prevention**
- For all adults, recommend regular weight bearing and muscle building exercises for prevention of osteoporosis and falls.
- Discuss fall prevention strategies with your patient. Tools include the Home Fall Prevention and Safety Checklist, Preventing falls in your home, and the KP Washington Health Research Institute article 10 things you can do to prevent devastating falls.
- Encourage patients to take their time when ambulating outside, especially around the curb and on rainy days.
- If a patient is unsteady, consider doing a fall risk assessment using the Timed Get Up and Go or other tool and/or referring the patient to Physical Therapy for fall risk assessment and walking aid recommendations.
- If appropriate, assess your patient for unhealthy alcohol use. Also assess for polypharmacy, including any medications that may cause sedation, dizziness or drowsiness
- If your patient has frequent falls, consider Physical Therapy referral to develop a personalized plan for improving balance and strength. Don’t exclude patients who reside in a nursing home or similar setting – they can also benefit from PT services.

**Calcium and vitamin D**
- Do not screen for vitamin D deficiency in adults age 50 or over without osteoporosis.
- If the recommended daily allowance is not achieved through diet alone, consider over-the-counter supplementation with:
  - Calcium 1200 mg a day in two divided doses; the body can only absorb about 600–800 mg elemental calcium in one sitting. For patients on acid-reducing agents like PPI or antacid, calcium citrate is the preferred form, as calcium carbonate needs acidity in the stomach to be absorbed. Calcium carbonate is best absorbed when taken after meals.
  - Vitamin D 1000–2000 IU a day (2000 IU a day in cloudier months of the year) for maintenance dose.

**Tobacco use**
- For all adults who are current smokers, recommend smoking cessation.
### Table 1. Recommendations for osteoporosis screening with DEXA scan

<table>
<thead>

<td></td>
</tr>
<tr>
<td>• Low body weight</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Men and women of any age with fragility fracture</td>
<td>No</td>
<td>Every 2–10 years depending on initial T-score</td>
<td>History of fragility fracture is diagnostic for osteoporosis. Assess for secondary causes of osteoporosis (see p. 5).</td>
</tr>
<tr>
<td>Men and women of any age with conditions known to be secondary causes of osteoporosis</td>
<td>No</td>
<td>Every 2–10 years depending on initial T-score</td>
<td>See p. 5 for secondary causes of osteoporosis.</td>
</tr>
</tbody>
</table>

1. While there is limited direct evidence to support screening for osteoporosis to reduce fracture risk, DEXA is recommended for women aged 65 years and older because of strong evidence that bisphosphonates significantly reduce hip-fracture risk for older women who have met the diagnostic T score criteria of lower than -2.5.

2. KPWA recommends screening only those who will be willing to initiate treatment.

3. Because of limitations in the precision of DEXA testing, a minimum of 2 years may be needed to reliably measure a change in bone density; however, longer intervals may be adequate for repeated screening to identify new cases of osteoporosis.

### The FRAX calculator

This tool estimates the 10-year probability of osteoporotic fracture for postmenopausal women and men aged 50 years and older who have not been previously treated for osteoporosis. Risk factors included in the FRAX are: age, gender, low body weight, height, previous fracture, parent with hip fracture, smoking status, glucocorticoid use, history of rheumatoid arthritis, menopausal status, and excessive alcohol consumption.

The FRAX calculator is available online at [http://www.shef.ac.uk/FRAX/](http://www.shef.ac.uk/FRAX/). Use the drop-down list under “Calculation Tool.”

**Limitations:** The FRAX calculator may underestimate fracture risk in patients with a history of a vertebral fracture, a hip fracture, or multiple fractures. Some risk factors, such as frailty and dementia, cannot be readily quantified and are not included in the calculation.
Diagnosis

History of fragility fracture is diagnostic for osteoporosis.

For patients without a fragility fracture, interpret DEXA results as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Results</th>
<th>Interpretation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bone density by DEXA ¹</td>
<td>T-score ⁴</td>
<td></td>
</tr>
<tr>
<td></td>
<td>T-score -2.5 and lower</td>
<td>Osteoporosis</td>
</tr>
<tr>
<td></td>
<td>T-score between -1.0 and -2.5</td>

</tr>
<tr>
<td></td>
<td>T-score -1.0 and higher</td>
<td>Normal</td>
</tr>
<tr>
<td>Z-score ⁵</td>
<td>Z-score -2.0 and lower</td>
<td>Below expected range for age</td>
</tr>
<tr>
<td></td>
<td>Z-score above -2.0</td>
<td>Within expected range for age</td>
</tr>
</tbody>
</table>

¹ May be measured and reported as a total hip score, the femoral neck score, and/or the L1 to L4 total lumbar score. Occasionally the distal radius is used if other sites are not practical or as an early indicator in hyperparathyroidism.

² DEXA result is based on the worst score of the individual scores of the spine, total hip, femoral neck, and when applicable, the one-third radius (forearm). Premenopausal women and men younger than 50 will only have Z-scores.

³ Although these definitions are necessary to establish the presence of osteoporosis, they should not be used as the sole determinant of treatment decisions.

⁴ The T-score represents the number of standard deviations a patient's bone density differs from the average bone density of a healthy 30-year-old of the same sex and ethnicity.

⁵ The Z-score represents the number of standard deviations a patient's bone density is from the average bone density of people their same age, sex, and ethnicity.
Evaluation for Secondary Causes of Osteoporosis

For patients diagnosed with osteoporosis or low bone mass, assess for secondary causes as follows:

Initial lab testing
Order the following tests (can be done before office visit). Selection of lab testing may be individualized as appropriate.

- Complete blood count
- 25-OH vitamin D
- In men: 8 a.m. total testosterone
- 24-hour urine for calcium and creatinine
- TSH
- PTH
- TTG and serum IgA
- Calcium with GFR
- Creatinine
- Hepatic function

If any conditions emerge from testing, work up and treat findings appropriately.

Medical history and clinical exam
Assess the patient’s medical history for the following conditions associated with osteoporosis:

Endocrine or metabolic disease (history, signs, or symptoms)
- Hyperparathyroidism/hypercalcemia
- Hypogonadism
- Hypopituitarism
- Hyperprolactinemia
- Cushing syndrome
- Hyperthyroidism
- Diabetes mellitus type 1
- Anorexia nervosa
- Acromegaly

Bone marrow–related disorders
- Multiple myeloma or myelodysplasia
- Thalassemia
- Systemic mastocytosis

Other conditions
- Rheumatoid arthritis
- History of organ transplantation
- Chronic kidney disease
- Secondary hyperparathyroidism due to renal disease
- Immobilization (paraplegia, quadriplegia, muscular dystrophy)
- Vitamin D deficiency
- Malabsorption (can be due to PPI therapy, celiac disease)
- Hypercalciuria
- Inadequate calcium intake

Medication review
Assess the patient’s medication list for the following medications associated with osteoporosis:

- Glucocorticoids (See Pharmacologic options for patients on long-term corticosteroid therapy, p. 10)
- Aromatase inhibitors
- Androgen deprivation therapy
- Anti-epileptics (e.g., phenytoin, phenobarbital)
- Excess thyroid replacement
- GnRH agonists (e.g., Lupron)
- Depo-Provera (medroxyprogesterone acetate)
## Treatment Overview

### Table 3. Recommendations for treatment of patients with osteoporosis or low bone mass

<table>

<td>Yes</td>
<td>Lower 10-year fracture risk (^1)</td>
<td>Treat the secondary cause and re-check DEXA in 2–3 years, or consider an e-consult with Endocrinology.</td>
</tr>
</tbody>
</table>

\(^1\) The FRAX tool recommends initiating therapy when 10-year probability of a hip fracture is 3% or higher and/or when 10-year probability of a major osteoporotic-related fracture is 20% or higher.

### Goal

Prevent fracture by decreasing risk factors and improving bone density to a T-score higher than -2.5. (The T-score target may be higher or lower in high-risk patients).

### Lifestyle modifications/non-pharmacologic options

Consuming adequate calcium and vitamin D, taking fall prevention precautions, and performing weight-bearing exercise should be continued when initiating pharmacologic treatment for osteoporosis.
Pharmacologic Options for Osteoporosis

Shared decision-making: bisphosphonates

Key points

- Fractures can have a tremendous negative impact on a patient’s quality of life.
- The benefits of bisphosphonates outweigh their potential risks.

<table>
<thead>
<tr>
<th>Table 4. Adverse effects associated with bisphosphonates</th>

<th>Medication ¹</th>
<th>Initial dose</th>
<th>Therapeutic/goal dose/duration of treatment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Patients with osteoporosis</td>
<td>1st</td>
<td>Alendronate</td>
<td>70 mg once weekly or 10 mg daily</td>
<td>5 years.</td>
</tr>
<tr>
<td>or Risedronate [F/ST] ²</td>
<td>35 mg once weekly or 5 mg daily</td>
<td>for intolerance to alendronate</td>
<td></td>
<td></td>
</tr>
<tr>
<td>or Zoledronic acid for GI intolerance to oral bisphosphonates</td>
<td>1st</td>
<td>5 mg IV infused over at least 15 minutes every 12 months</td>
<td>3 years</td>
<td></td>
</tr>
<tr>
<td>2nd</td>
<td>Denosumab [PA—consult with Endocrinology] ³</td>
<td>60 mg as a single dose, once every 6 months</td>
<td>No studies have evaluated the optimal duration of treatment.</td>
<td></td>
</tr>
</tbody>
</table>

¹ Use bisphosphonates with caution in patients with chronic kidney disease and reduced glomerular filtration rate. Current drug monographs state that an estimated GFR < 35 mL/min is a contraindication to bisphosphonate use.

² F/ST = Formulary/Specialty Tier

³ Denosumab may be considered only after failed trial of oral and IV bisphosphonates. See PA criteria.

Baseline tests
Before initiating therapy, order these baseline tests: 25(OH) vitamin D level, serum calcium, and creatinine.

Considerations while taking osteoporosis medication
- To ensure absorption, advise the patient to take oral bisphosphonates with water only and not with food or other medications.
- **Calcium supplementation:** Use calcium citrate in patients taking proton pump inhibitors (PPIs) or H2 blockers.
- **Vitamin D:** Optimize 25 OH vitamin D > 30 and ensure that hypocalcemia is not present.
- **Dental hygiene:** Educate patients starting a bisphosphonate about the importance of regular dental cleanings and good dental hygiene. For those patients who have a planned tooth extraction or dental implant surgery, consider delaying the start of bisphosphonate therapy until 3 months after completion of the dental procedure, or until maxillofacial bone healing is complete. Both considerations are based upon the moderate evidence for association of osteonecrosis of the jaw (ONJ) with bisphosphonate use (0.001% to 0.069% per year increased incidence over non-bisphosphonate users).

Interventions to reduce side effects
- If the patient has GI intolerance with oral bisphosphonates, try risedronate or switch to IV zoledronic acid. Some patients tolerate one better than the other. If the patient can’t tolerate either option, refer to Endocrinology to discuss denosumab (Prolia).
- There is strong evidence for an acute phase reaction within 3 days of zoledronic acid administration (up to 25% increased risk over placebo of any of the following symptoms: pyrexia, myalgia, headache, arthralgia, chills). A 650 mg dose of acetaminophen initiated 45 minutes before zoledronic acid infusion and continuing every 6 hours for 3 days has been shown to reduce severity of symptoms. It is common practice also to ensure the patient is well hydrated prior to infusion.

Pharmacologic options not recommended for osteoporosis
Tamoxifen, estrogen, nasal calcitonin
Stopping bisphosphonate therapy/drug holidays

Higher-risk patients
Patients with a history of fragility fracture or a T score lower than -3.5 may benefit from up to 10 years of oral bisphosphonate or 6 years of IV bisphosphonate.

Lower-risk patients
Patients with mild to moderate osteoporosis and no fragility fracture while on therapy may be considered for a drug holiday after 5 years of therapy. There is insufficient evidence to guide treatment for more than 5 years.

If bone density is measured and:
- The patient has **achieved goal density**, the bisphosphonate may be stopped, and dietary and lifestyle modifications continued.
- The patient has a **T-score lower than -2.5**, explore adherence to treatment. If adherence is not an issue, consider one of the following:
  - Continue bisphosphonates for an additional 2–5 years. (The safety of long-term [more than 10-year] use of osteoporosis medications is not known.)
  - Recommend a “drug holiday” for 2 years, followed by 3 more years of therapy.
  - Consider switching to another class of medication.
  - Consider stopping bisphosphonate treatment and continuing dietary and lifestyle modifications.
- The patient has **decreased bone density from baseline**, consider consultation with an endocrinologist or rheumatologist.

| Table 6. Additional considerations for drug holiday in patients at low risk for fragility fracture |
|---------------------------------------------------------------|---------------------------------------------------------------|
| **Fall risk/fracture**                                         | **Factors favoring continuing therapy** ¹                      | **Factors favoring drug holiday with monitoring**               |
| Increased fall risk or history of osteoporotic fracture while on bisphosphonate therapy for 6 months or more | Not at high risk for falls                                    |
| **High-risk medications**                                     | Taking high-risk medications                                 | Not taking high-risk medications                               |
| Prolonged suppressed TSH or history of hyperparathyroidism or rheumatoid arthritis that is not reversed by treatment | Normal thyroid and parathyroid function, no history of rheumatoid arthritis |
| **Change in bone density while consistently taking bisphosphonates** | Absolute reduction of 5% or more between two successive BMD measurements at the same site | Absolute reduction of less than 5% between two successive BMD measurements at the same site |
| **T-score/Z-score**                                           | T-score lower than -3.5 at any site or Z-score -2.0 or lower  | T-score higher than -2.5                                       |

¹ If patient has one or more factors favoring continuing therapy, has been adherent to therapy, and has a **probable cause of malabsorption** (e.g., PPI therapy, celiac disease, Crohn’s disease, gastric bypass, or bowel resection), **switch to IV zoledronate** and repeat DEXA after 2 more years of therapy.

If patient does not have a **probable cause of malabsorption**, has been adherent to therapy, and has one or more factors favoring continuing therapy, evaluate for secondary causes of osteoporosis (see p. 5).

**During continuing therapy**
Ensure adherence to bisphosphonate therapy and repeat DEXA after 2 years of therapy. E-consult with Endocrinology if considering prolonged therapy for 5–10 years (oral) or > 5 years (IV).

**During drug holiday**
Measure bone density in 2 years or upon occurrence of new fragility fracture.
Pharmacologic options for patients on long-term corticosteroid therapy

Because long-term use of corticosteroids—defined as 5 mg/day prednisone for 3 consecutive months—is associated with increased risk of osteoporosis, it is reasonable to consider starting prophylactic therapy in patients on chronic steroids. The dose of steroid treatment for which the benefit of treatment with bisphosphonates is thought to outweigh the risk ranges from 5 to 7.5 mg/day.

To decrease the risk of developing osteoporosis, assess patients on corticosteroids to see if it would be appropriate to:
- Reduce the dose
- Switch to a topical or inhaled form
- Switch to an alternative drug

Prevention of steroid-induced osteoporosis

Medications for the prevention of steroid-induced osteoporosis are appropriate for men and women who are taking oral corticosteroid medication at a dose of ≥ 5 mg/day prednisone or equivalent for a duration of 3 months or more and have a FRAX 10-year risk of hip fracture ≥ 3%. Risedronate and zoledronic acid are FDA-approved for both the treatment and prevention of steroid-induced osteoporosis. Alendronate is not FDA-approved for the prevention of steroid-induced osteoporosis.
- First-line: oral risedronate (5 mg/day)
- Second-line: IV zoledronic acid (5 mg IV infused over at least 15 minutes every 12 months)

Treatment of steroid-induced osteoporosis

- First-line: alendronate (5 mg/day) should be prescribed for most patients. Postmenopausal women not receiving estrogen should be prescribed 10 mg once daily.
- Second-line: risedronate (5 mg/day)
- Third-line: IV zoledronic acid (5 mg IV infused over at least 15 minutes every 12 months)

Monitoring/follow-up for patients with steroid-induced osteoporosis

- A DEXA scan within the first 6 months of starting steroids is recommended, due to the rapid bone loss that occurs during the first 3–6 months.
- If steroid use is continued, a DEXA scan is recommended every 2–3 years after the initiation scan.
Follow-up/Monitoring

Patients who have *not* sustained a fracture

<table>
<thead>
<tr>
<th>Baseline or most recent DEXA score and/or clinical circumstances</th>
<th>Recommended screening interval</th>

When to consult with Endocrinology

Consider an e-consult with Endocrinology if:

- Patient has had 10 years of bisphosphonate and needs more therapy
- Patient with fragility fracture or osteoporosis has significant renal disease and may not be a candidate for bisphosphonate therapy
- Bisphosphonate therapy fails, as when a fracture occurs during active treatment
- Osteoporosis is unexplained, with no risk factors and negative workup
- Patient is intolerant of bisphosphonate therapy after trial
- Patient needs anabolic therapy (Forteo) because of multiple compression fracture, severe osteoporosis, or treatment failure
Evidence Summary/References

To develop the Osteoporosis Screening, Diagnosis, and Treatment Guideline, the guideline team adapted recommendations from the following externally developed evidence-based guidelines:

Guideline Development Process and Team

Development process
To develop the Osteoporosis Guideline, the guideline team adapted recommendations from externally developed evidence-based guidelines and/or recommendations of organizations that establish community standards.

This edition of the guideline was approved for publication by the Guideline Oversight Group in April 2019.

Team
The Osteoporosis Guideline development process included representatives from the following specialties: endocrinology, family medicine, geriatrics, nursing, and pharmacy.

Clinician lead: John Dunn, MD, MPH, Medical Director, Preventive Care
Guideline coordinator: Avra Cohen, MN, RN, Clinical Improvement & Prevention
Clinicin expert: Avantika Waring, MD, Endocrinology
Blair Becker, MD, Family Medicine & Activity, Sports and Exercise Medicine
Andrea Grace, MD, CMD, Geriatrician
Jeff Kintner, PharmD, Pharmacist
Judy Lee, MD, Endocrinologist
Alison Meyer, ARNP, Fracture Follow-up, Clinical Improvement & Prevention
Ann Stedronsky, Clinical Publications, Clinical Improvement & Prevention

Disclosure of conflict of interest
Kaiser Permanente requires that team members participating on a guideline team disclose and resolve all potential conflicts of interest that arise from financial relationships between a guideline team member or guideline team member's spouse or partner and any commercial interests or proprietary entity that provides or produces health care–related products and/or services relevant to the content of the guideline.

Team members listed above have disclosed that their participation on the Osteoporosis Guideline team includes no promotion of any commercial products or services, and that they have no relationships with commercial entities to report.
